

**S08 - SCREENING OPERATION, PROCESS MATERIAL, WET, UNCONTROLLED, AWR / MPI / DISTRICT  
4/9/96 METHODOLOGY**

**CALCULATION METHODS**

(Fugitive Releases)

$$E_a = U_a \times EF \times C_i$$

$$E_h = U_h \times EF \times C_i$$

(Ducted Releases)

$$E_a = 0$$

$$E_h = 0$$

**Notes:**

- The AWR / MPI / District Screening Operation Emission Factors for this material are 0.00084 lbs PM10 and 0.00178 lbs TSP per ton material processed.
- The PM10 factor is based upon the uncontrolled Screening value in Section 11.19.2, Table 11.19.2-2 of AP-42 (1/95) and the District - AWR - MPI agreement dated 4/9/96.
- The TSP factor is calculated using a (0.74/0.35) ratio of particle size multipliers from Section 13.2.4 of AP-42 and the above PM10 value.
- The trace metal default concentrations are based on an AWR material analysis for crushed miscellaneous base, (Profile 7), submitted to the District in July 1996. Use site specific data if available.
- Screens processing dry material should not be evaluated with this procedure. Note: Screens processing wet material should not require controls.
- Per the AWR / MPI / District agreement;  
 "Process" Material = Aggregate Streams composed of material that is 70% or more by weight > #4 mesh.  
 "Fines" Material = Aggregate Streams composed of material that is 30+% by weight < #4 mesh.  
 "Dry" Material = "Process" streams with an average moisture content of <1.5% and "Fines" streams with an average moisture content of <3.0%.  
 "Wet" Material = "Process" streams with an average moisture content of 1.5% or more and "Fines" streams with an average moisture content of 3.0% or more.  
 "Zero" emissions will be assumed for water washed aggregates with visible moisture as well as any material with an average moisture content of 5% or more
